Mean years of schooling:  
GNI per capita:  
GNI:  
Population:  
House quality:  
modern or rustic,

Houses are often

packed with high tech

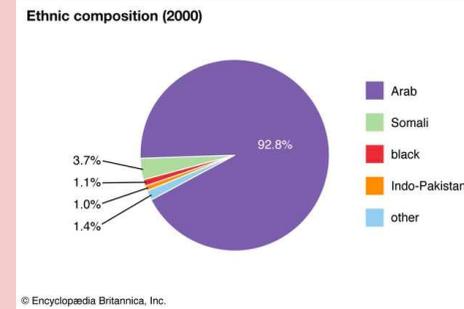

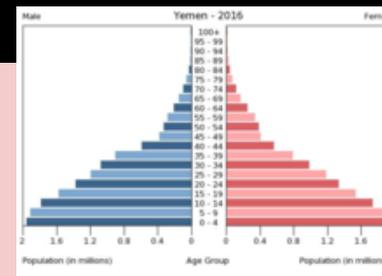

Great. It is second Switzerland has a reliable, efficient, safe and clean public transport. It is not only environmentally conscious, but also has a high quality hygiene regime, with over 4 doctors per 1000 people, and even helps other developing countries with their TPH program!

As we see in the population graph, the majority of the population are ages with people who work and generate income. This is a reason for their high GNI. Its location in Europe allowed it to be much more powerful, and not just a mere colony, and higher schooling years prove that intelligent people stay and that people are more educated. This then means that higher tier jobs and industries are generated. As we see the main ethnic group is the German with an astonishing 65%. As we know, the Germans have a tendency to recuperate quickly and have a stable economy.

The GNI per capita is not only influenced by the large GNI but also by the small population: 3.5 times less than that of Yemen.

# YEMEN

28.5M  
Houses are cheap,

wood and are easily broken

Awful. More than Yemen has almost no public transport, out of 3000 healthcare facilities, only half are functional and only 40% provide cures, and 43% can diagnose malaria. There are 6.2 hospital beds for every 10 000 people. They have only 0.3 doctors per 1000 people.

often made of

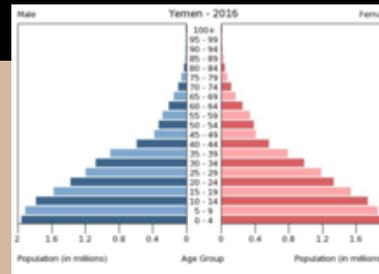

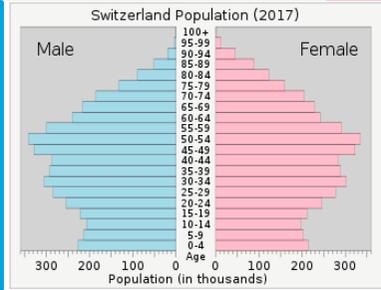

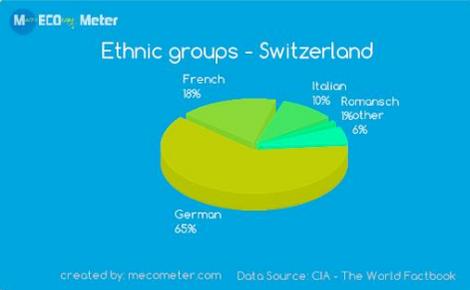

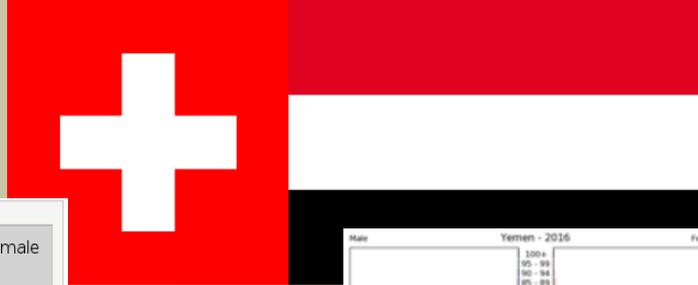

Healthcare:  
8

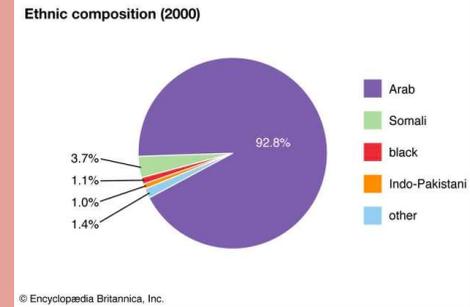

As we see in the population graph, the majority of the population are ages with young people and newborns, and the top of the graph is very small, signaling early deaths. The small number of working population is a reason for its bad state. As well as bad health facilities, and the close to none amount of generated income, it is currently undergoing a civil war which started in 2015. There is a large portion of terrorists there, including part of the Al Qaeda group, which is unofficially fighting in the war.

Fortunately, its position in the 'cross-road' that the Middle East is, it provides Yemen with a nice amount of imports and exports, even if these numbers have dwindled since the start of the war.
